

## Social Studies #5 answer

The different types of human are different by what they did or achieved and their brain size. For instance Australopithecus had one-third the size of our brains. Also Homo habilis's brain is half the size of our brains. Homo habilis used early stone tools for chopping and scraping. Homo erectus learned how to use stone hand axes and learned how to control fire. Finally Homo sapiens (modern humans) achieved a lot of things like migrating around the world, learned to create fire, used variety of tools, and developed language.
